

Atmospheric Boundary Layer Wind Structure Measured by the Doppler Wind Lidar near CCT, Ny-Ålesund

March 11, 2025

Sang-Jong Park

Objective

- RIS-ID: 10247 (Title)
- Objectives:
 - ✓ By measuring vertical profile of wind in Ny-Alesund year-round
 - ✓ To understand turbulent structure in the Arctic boundary layer under various environmental conditions: surface, stability etc
 - ✓ To understand entrainment below Arctic cloud
 - ✓ To help other researches requiring wind distribution in Ny-Alesund

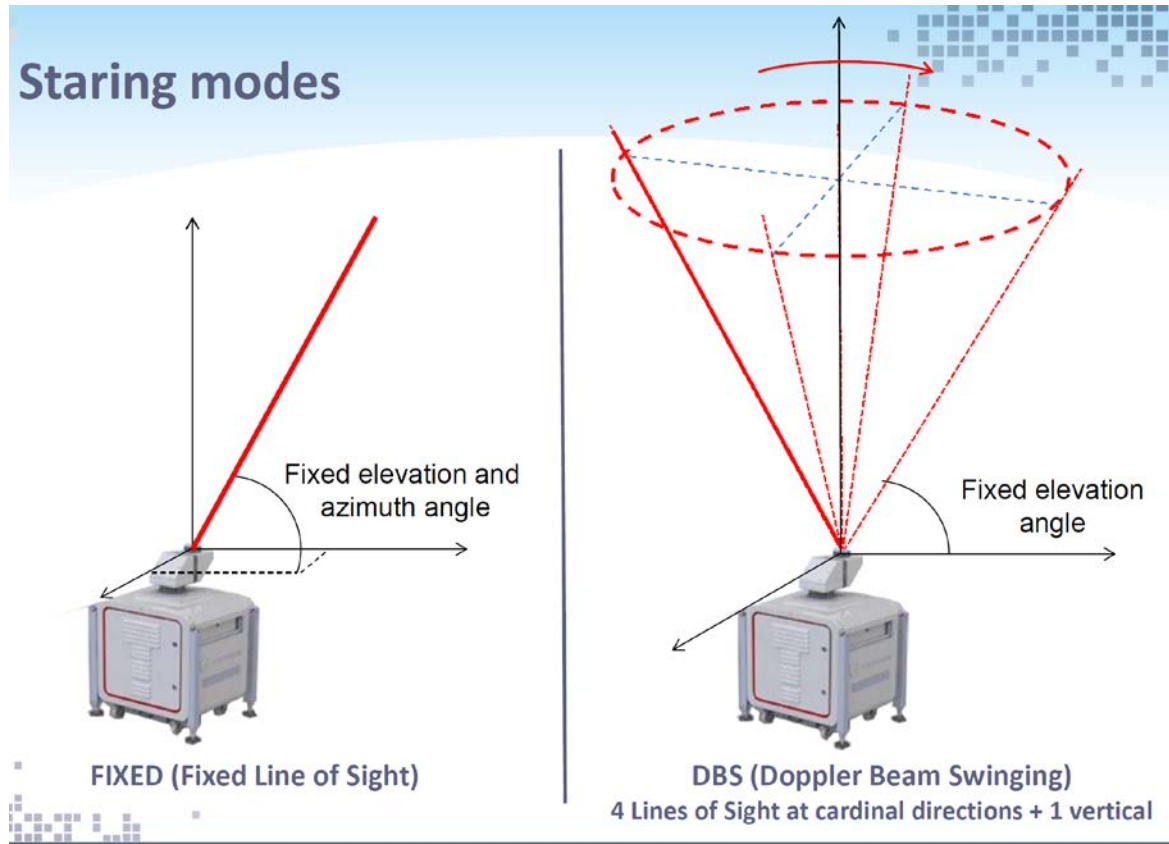

Instrument - principle

- Model: Doppler wind lidar (Windcube-100S, Leosphere)
- Principle: obtain radial velocity by measuring doppler effect by particles in the air

Instrument - modes

- Modes: LOS and DBS

Instrument - modes

- Modes: PPI and RHI

Ref) WLS-100S HW
manual rev.7

➡ Radial velocity (LOS, RHI, PPI), Wind vector (DBS)

Instrument – current configuration

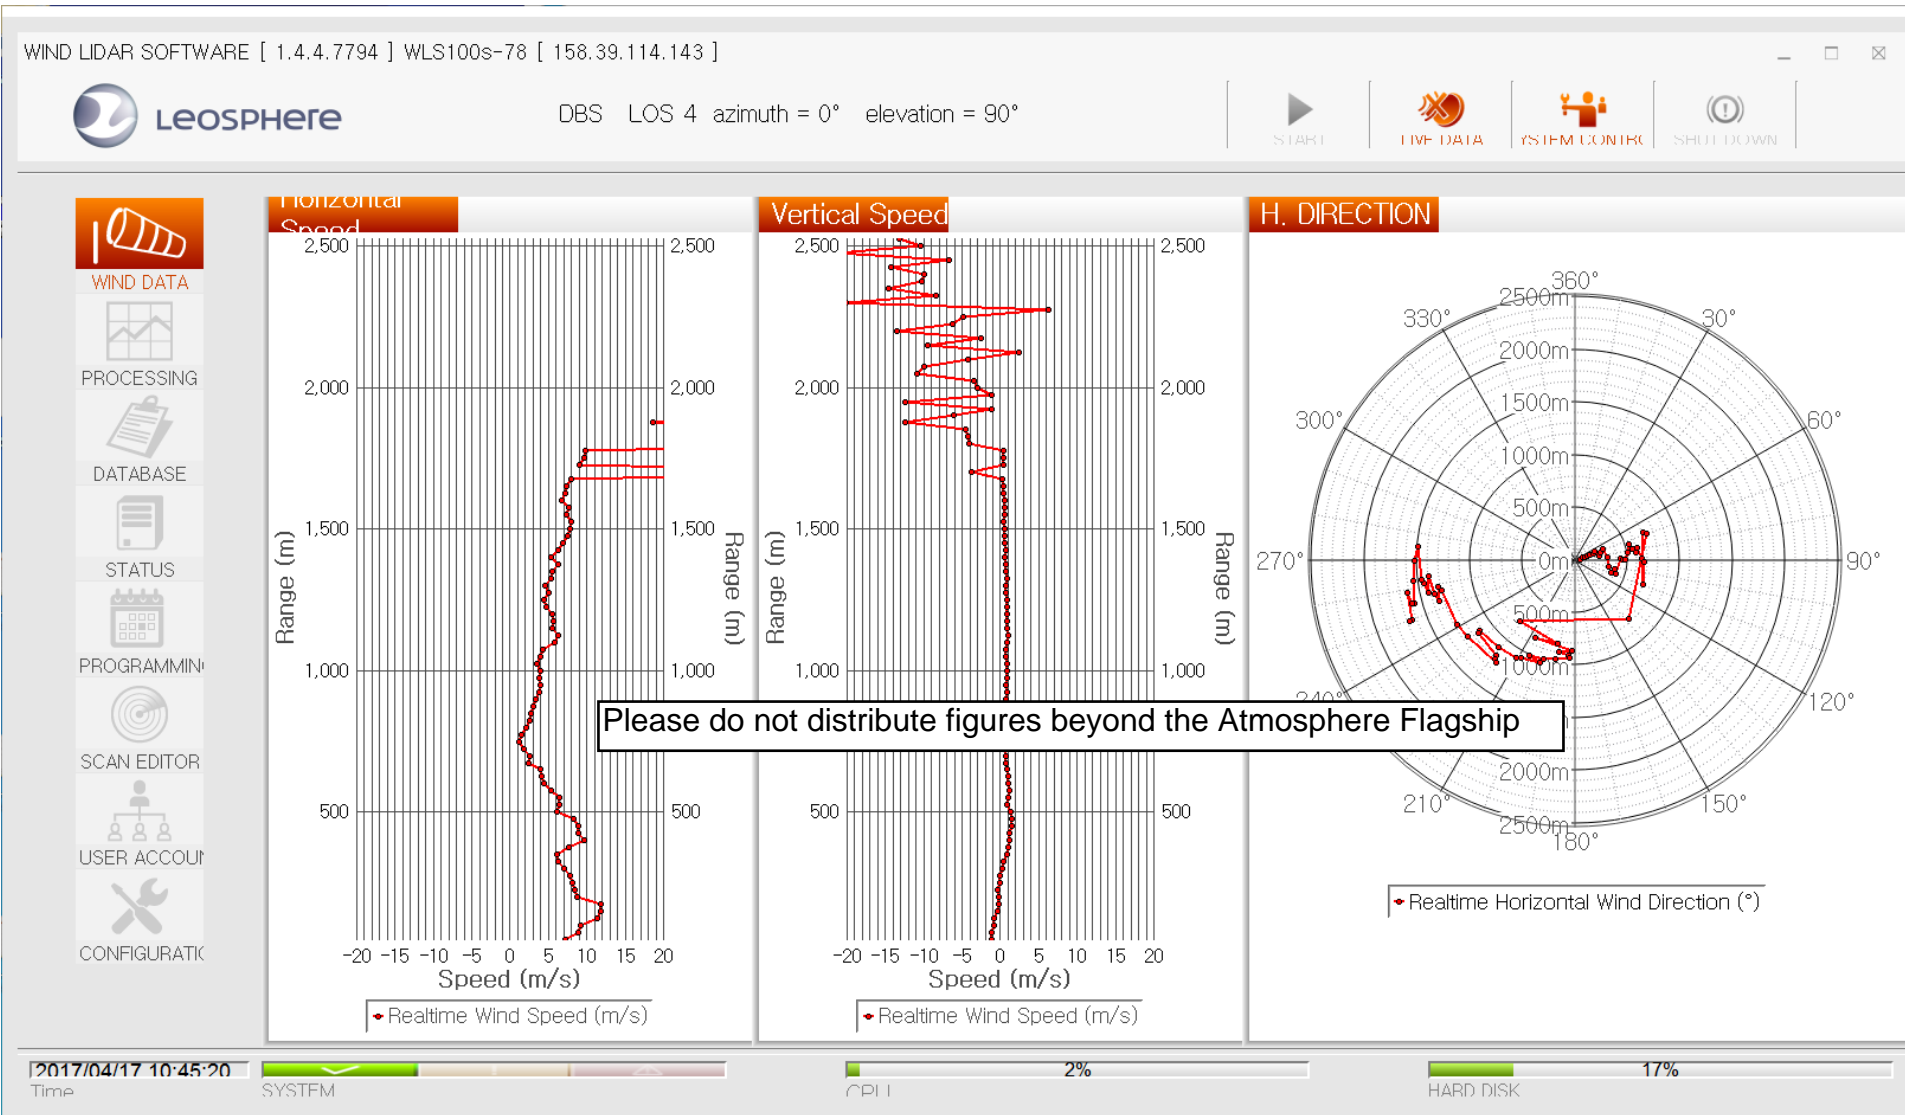

- Combination of DBS, RHI, PPI, LOS at ~ 30-min cycle
- 25-m interval from 100m AGL
- One cycle
 - DBS * 5 times
 - PPI * 1
 - RHI_East_West * 1
 - RHI_North_South * 1
 - LOS * 1200 sec

Instrument - location

- Location: ~50m northeast from the CCT
- Period: year-round since April 2017

Example of observations - 1

DBS (vertical profile of wind, usually < 1 km)

Example of observations - 2

WIND LIDAR SOFTWARE [1.4.4.7794] WLS100s-78 [158.39.114.143]

PPI_5deg LOS 179 azimuth = 358° elevation = 5°

DBS data contents (30-min interval)

Possible applications

- Vertical profile of horizontal wind depending on atmospheric stability
- Vertical profile of turbulence intensity
- Seasonal variations of the vertical profiles
- Interaction between the surface and ABL
- ABL-cloud interaction (entrainment)
- Horizontal distribution of wind over NyAlesund

Issues

- Too clean air lowers data retrieval sometimes
- Frequent upward wind
- Quality control of the data and producing user-friendly output to increase data usage in the NyA community
- HW Maintenance in need (probably in 2026)

Acknowledgments

- Thanks to AWI (Christopher Ritter), ISP-CNR (Mauro M. and Angelo V.) for their support since 2016
- The BL measurement has been supported by PE25010 (KOPRI) project.

Thank you for attention.
Welcome questions and comments.
